

Sample API Script

The provision of this sample script is meant as an aid for NGE/3P users to make authenticated calls to DataHive APIs.

DR owners can download the sample script from the "Data request details" pop up as shown below. The same copy of sample script will be attached in an email sent to the NGE/3P user upon DR fulfilment.

Data request details

X

Purpose description

a) What is the project/task being undertaken?
test test test test test test test test test test

b) Is de-identified data sufficient for completing this project or task? ⓘ

Yes.

c) Will the results or data be published in any non-government forum/platform?

No.

d) Will the results or data be provided to any other agency or non-government entity?

Yes.

Non-government data sharing

- Please read and understand the usage of the files as described in this section, especially on handling of `config.json` file.
- Usage of this script in either development or production systems is at the user's discretion.

By extracting the zip file downloaded from the highlighted link or the email attachment, you will find 3 files in it.

File name	Description
api_script.py	This is the main script that you run to call the DataHive API.
requirements.txt	This file contains the list of python dependencies needed to run the script.
config.json	This file contains the configurations and credentials (user and account IDs) required to run the script to make authenticated calls to DataHive APIs. ⚠ As this file contains your credentials, please adhere to the following rules when handling this file: • DO NOT share this file to anyone. • DO NOT commit this file to any source code management (SCM) tool such as <code>git</code>.

To run the script, ensure you have `python` installed and then run the following command to install dependencies:

```
python -m pip install -r requirements.txt
```

Move your private key `rsa_key.p8` to the same folder as the sample script.

Configure the private key passphrase in your environment if your private key is encrypted. If your private key is unencrypted, you can skip this step.

```
export PRIVATE_KEY_PASSPHRASE='<passphrase>'
```

Then run the following command:

```
python api_script.py
```
