

Geospatial

The geospatial module of the SDK can help users do geospatial analysis in Databricks.

Registering Sedona module

Registration is only required when using the Apache Sedona Python API (e.g.

`GeoDataFrame.pipe(spark.createDataFrame())`). For more information on usage, you may refer to this [page](#).

You can find more information of Sedona related functions [here](#).

Function signature

Sample usage

```
def register_sedona() -> None:
    """
    Returns
    -----
    None
    """
```

Convert GeoJSON to Dataframe

Function signature

Sample usage

```
def read_geojson_raw(geojson_str, output_type="spark"):
    """
    Function to transform raw geojson string into dataframe.
    Geojson format: https://datatracker.ietf.org/doc/html/rfc7946#section-1.5

    Parameters
    -----
```

```
geojson_str : str
    String representation of geojson
output_type : str, optional
    `spark` or `geopandas` dataframe (default is spark)
```

Returns

dataframe

Geojson in table format. `geometry` column in WKT format.
"""
