

Graphs

This section covers creating and editing graphs in the data visualisation feature. Currently, only time series visualisations are supported.

Generating time series visualisation

You can generate a consumption time series for:

- Layer
- Multiple layers
- Specific cluster

There are 2 possible aggregations for consumption values: average and sum.

CAUTION

There needs to be at least 1 filter for consumption time series values to be made available for previewing.

Aggregation by layer

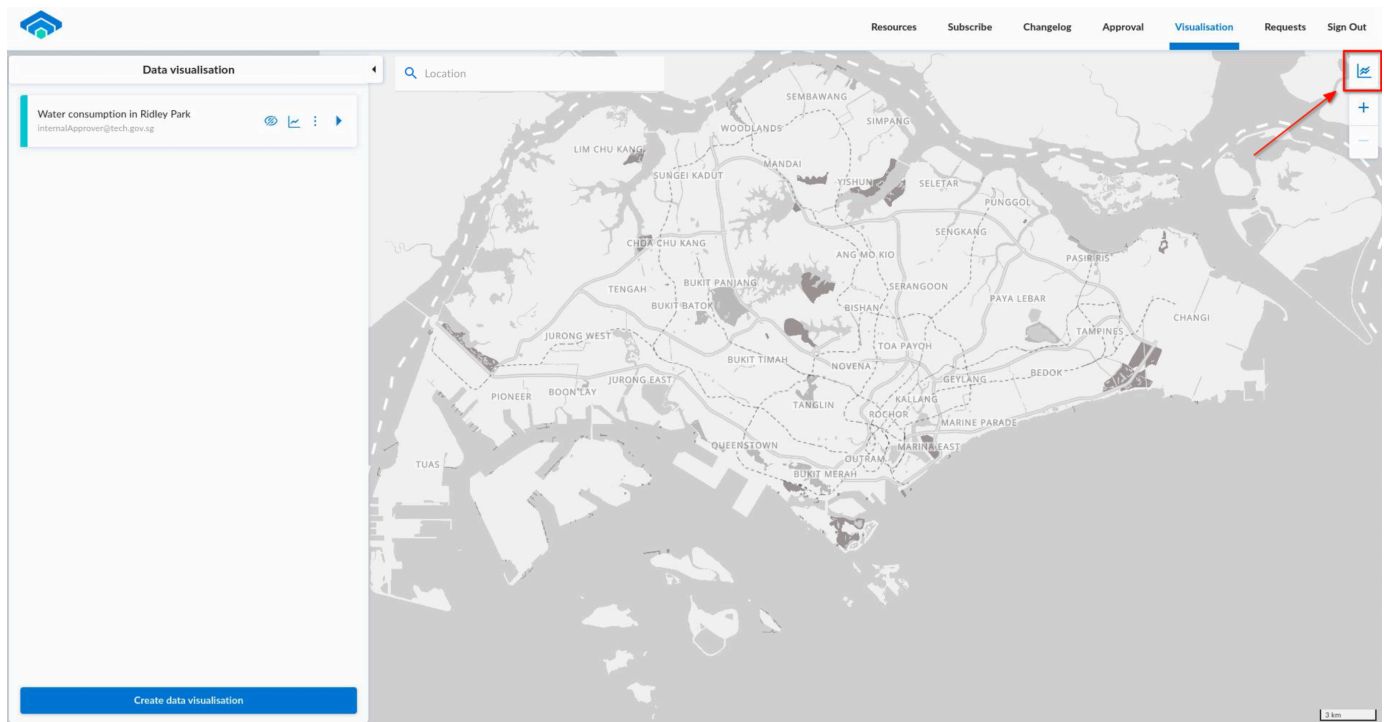

To create a time series visualisation for a layer:

1. Click on the [show graph button](#) of the layer.
2. Modify the [time series visualisation settings](#) to fit your requirements.

Aggregation by multiple layers

To create a time series visualisation from multiple layers:

1. Click on the graph widget on the top right corner of the map.

2. Complete the [layer selection form](#) to indicate the dataset and layer that you want to visualise.

Aggregation by specific cluster

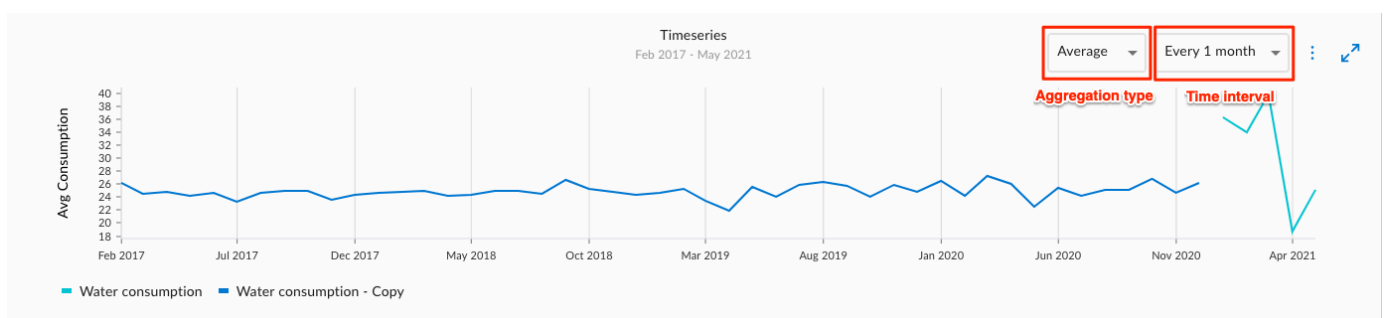

To create a time series visualisation for a specific cluster:

1. Click on the cluster that you want to generate a visualisation for.
2. If the cluster selected contains data points from more than one layer, you have to complete the [layer selection form](#) to indicate the dataset and layer that you want to visualise.

Time series visualisation settings

After a time series visualisation is generated, you can modify the following settings:

- **Aggregation Type:** The type of aggregation to perform on the consumption values.
- **Time Interval:** The length of time to group the data points by (e.g. Every 1 month).

Layer selection form

There are 2 scenarios where you must specify which dataset and layers to display:

1. When a [cluster](#) you want to visualise contains data points from more than 1 layer; or
2. When you want to visualise [globally across multiple layers](#).

The layer selection form will be shown in the bottom pane:

To complete the layer selection form, fill in the following:

! INFO

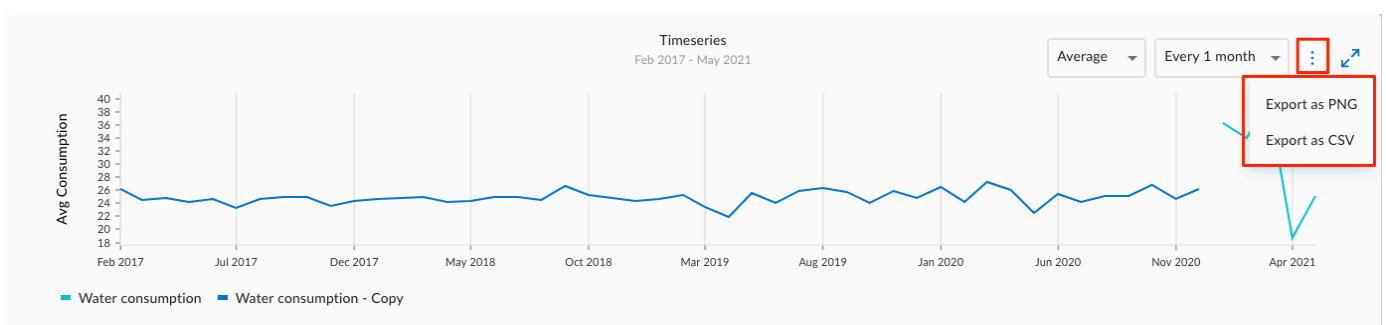

Creating time series visualisation for layers from different datasets is not supported.

- **Dataset:** The dataset to visualise.
- **Layers Selection:** The layers with the selected dataset.

After filling the form, click on "Visualise on graph" to generate a time series visualisation.

Export time series visualisation

Before you can export a time series visualisation, you need to [generate one](#) first. You can then export by clicking on the icon button as follows:

Select the export option that you want. Currently, you can export it as [csv](#) or [png](#).

Zooming in time series visualisation

If you like to zoom into a particular section of the time series visualisation, you can do so by dragging onto a particular segment of the line chart.
